## Off-hole conductors confirmed beneath nickel sulphides in new area at Talc Lake

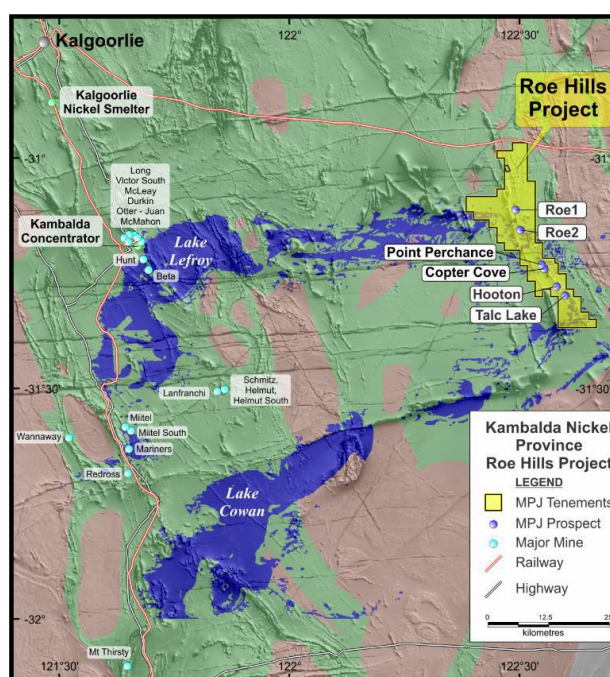

### Key Points

- Two off-hole conductors identified below recently intersected nickel sulphides in new area on eastern edge of Talc Lake Prospect
- At least one of these conductors may indicate the development of better mineralisation, including massive nickel sulphides proximal to the hole.
- Detailed assessment of all geological and geophysical data underway ahead of drill testing of this high-priority target area.
- Assays received for hole RHDD0023 at Talc Lake confirm previously reported presence of nickel bearing sulphides: 1.3m at 0.5% nickel.

Mining Projects Group (ASX: MPJ) is pleased to advise that it has confirmed the presence of off-hole conductors situated below recently intersected nickel sulphides at its Talc Lake Prospect, part of its 100%-owned Roe Hills Nickel Project, located near Kambalda in WA (Figures 1 & 2).

**Figure 1. MPJ projects location in Western Australia**

**Figure 2. Roe Hills Nickel Project geographical location including relevant infrastructure**

The conductors were identified during geophysical surveying of recently completed holes RHDD0026 and RHDD0027, which are located in a new area on the eastern edge of Talc Lake (Figures 3 & 4).

These holes, which were drilled 600m apart, represent the first effective test of what is now interpreted to be the basal ultramafic sequence at Talc Lake.

Technical Director Mr Neil Hutchison said, “These results are an extremely exciting development in locating Massive Nickel Sulphides at Roe Hills. The eastern sequence is interpreted to be the main basal ultramafic flow in the Talc Lake area and potentially the most prospective. Newexco have identified new significant conductors coincident with recent Nickel Sulphide intersections within this sequence. These targets will be included in the high priority list for follow up drilling.”

Both holes encountered well developed zones of disseminated, blebby and narrow veinlet massive nickel bearing sulphides with spot readings of up to 7 per cent nickel from portable Niton XRF (see ASX release dated November 26, 2015). Assays are pending on both these holes.

Hole RHDD0027 in particular intersected three zones of nickel sulphide mineralisation with the deepest zone extending over approximately 50m between the down hole depths of 320m and 370m (Figure 5).

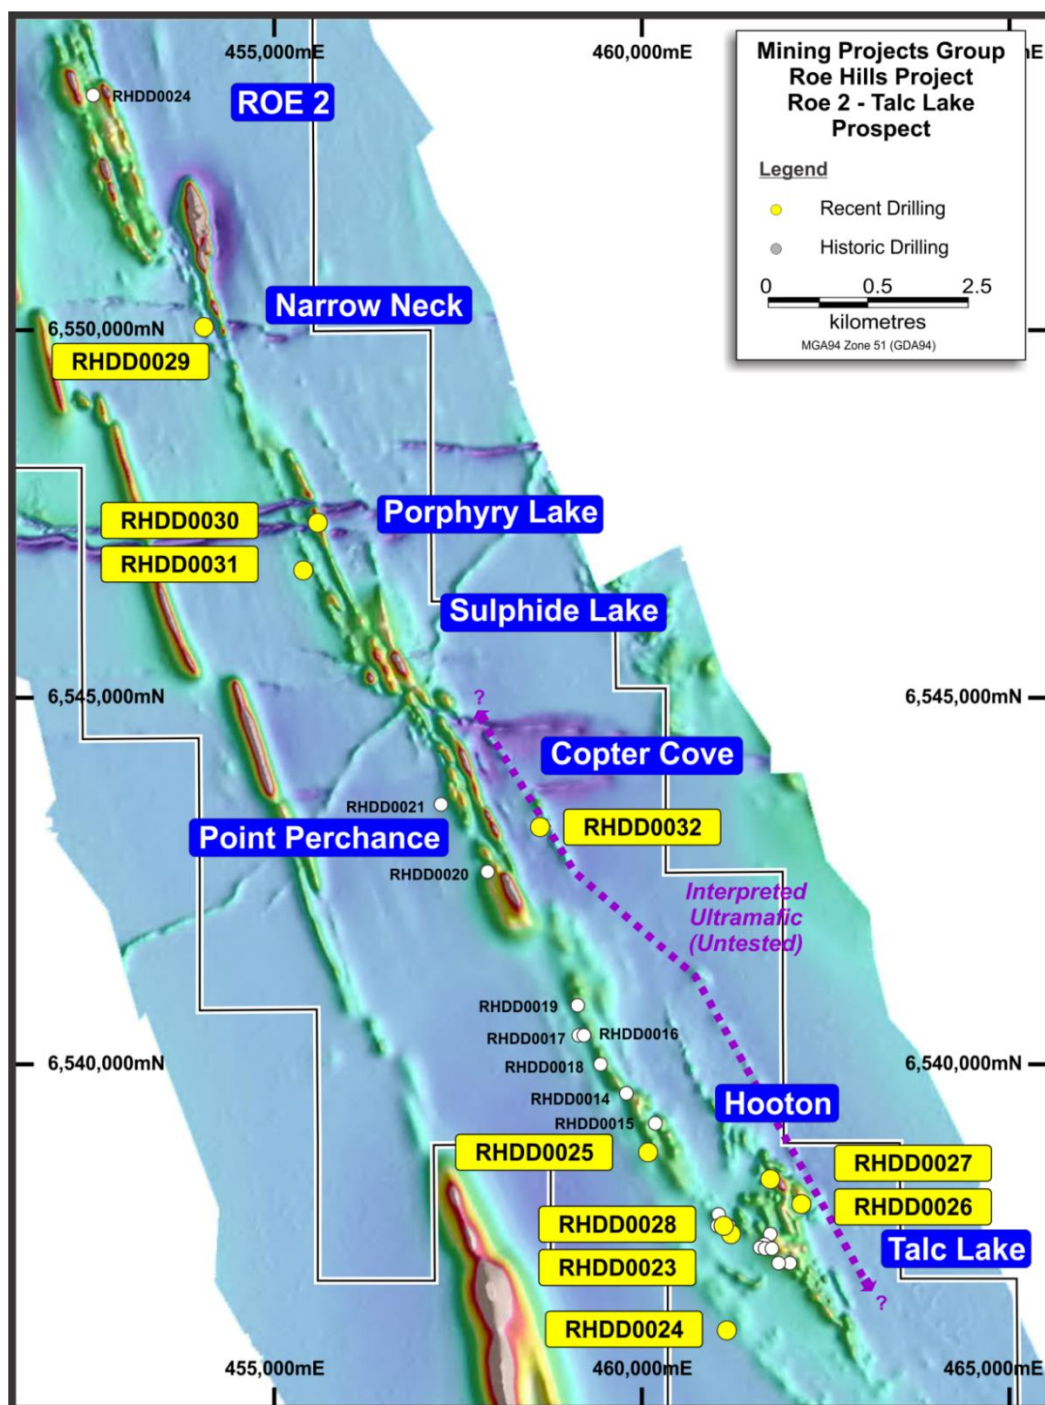

Figure 3: Drilling Locations

A preliminary assessment of the DHEM data by the Company’s geophysical consultants, Newexco, reports a strong off-hole conductor situated north of RHDD0026. This conductor is possibly coincident with a shale horizon north of the hole, however as seen elsewhere there is often a close spatial relationship between shales and nickel sulphide accumulations. Consequently the conductor is considered worthy of further evaluation.

Newexco also reports off-hole responses from RHDD0027. The intersection responses within RHDD0027 appear to be related to sulphidic black shales internal to the ultramafic sequence while the off-hole responses are coincident with zones of nickel-bearing sulphides and may indicate the development of better mineralisation, including massive nickel sulphides proximal to and down dip of the hole (Refer Figure 5).

A detailed assessment of all available geological and geophysical data is in progress to guide follow-up drill testing of this emerging high priority target area.

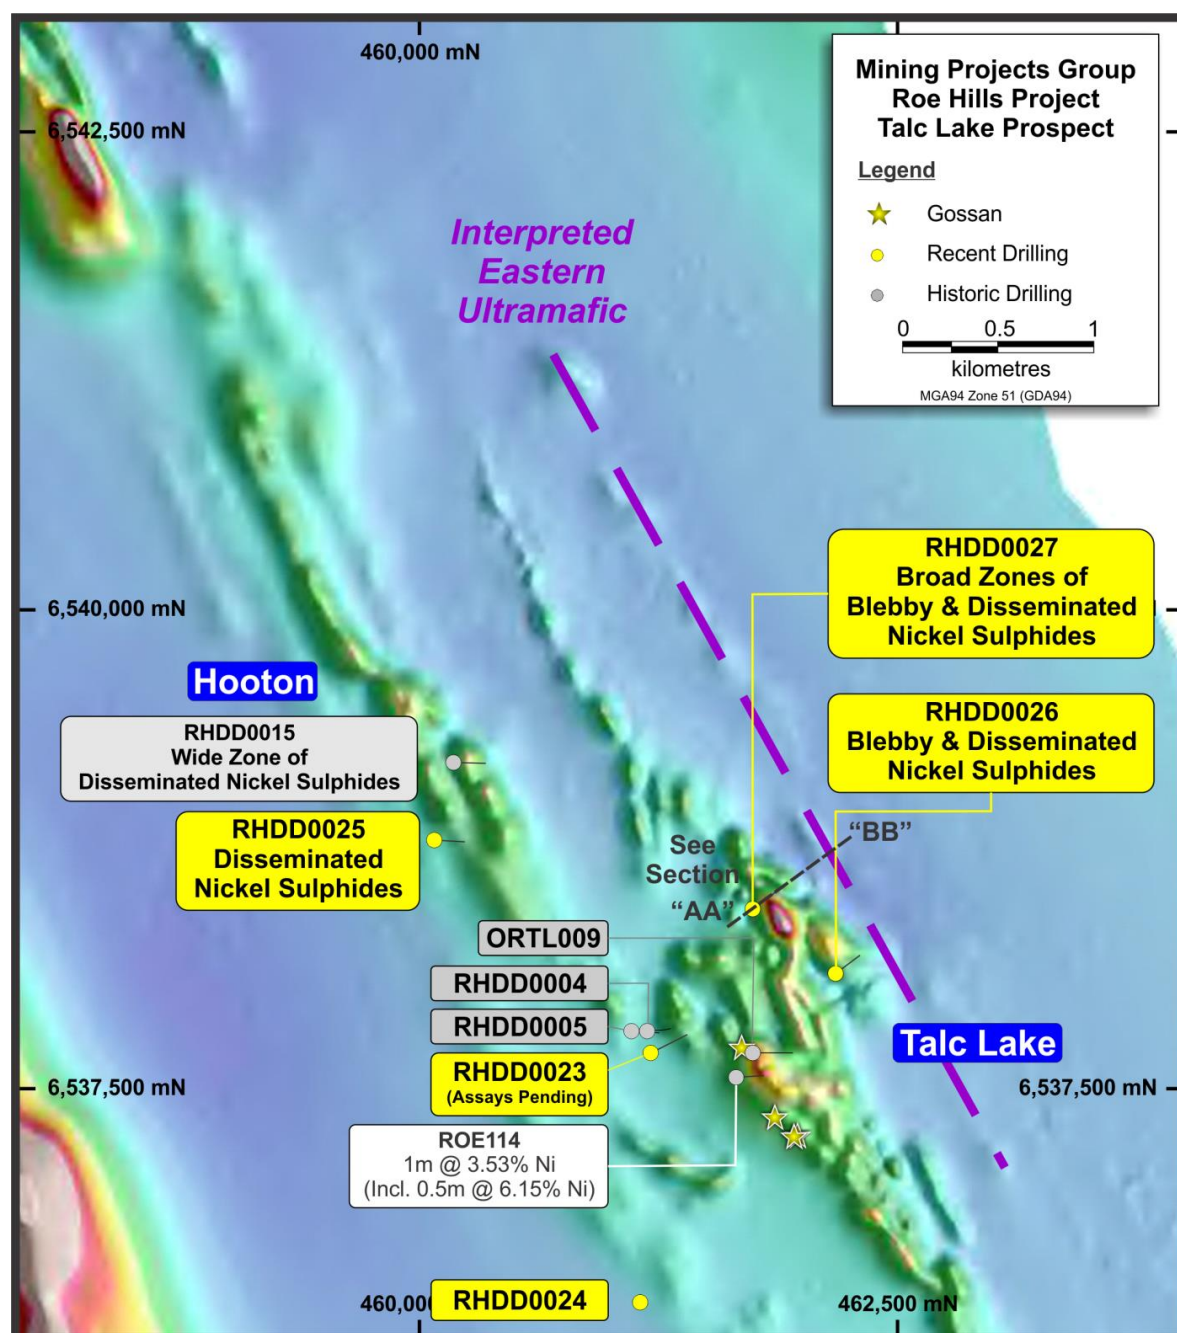

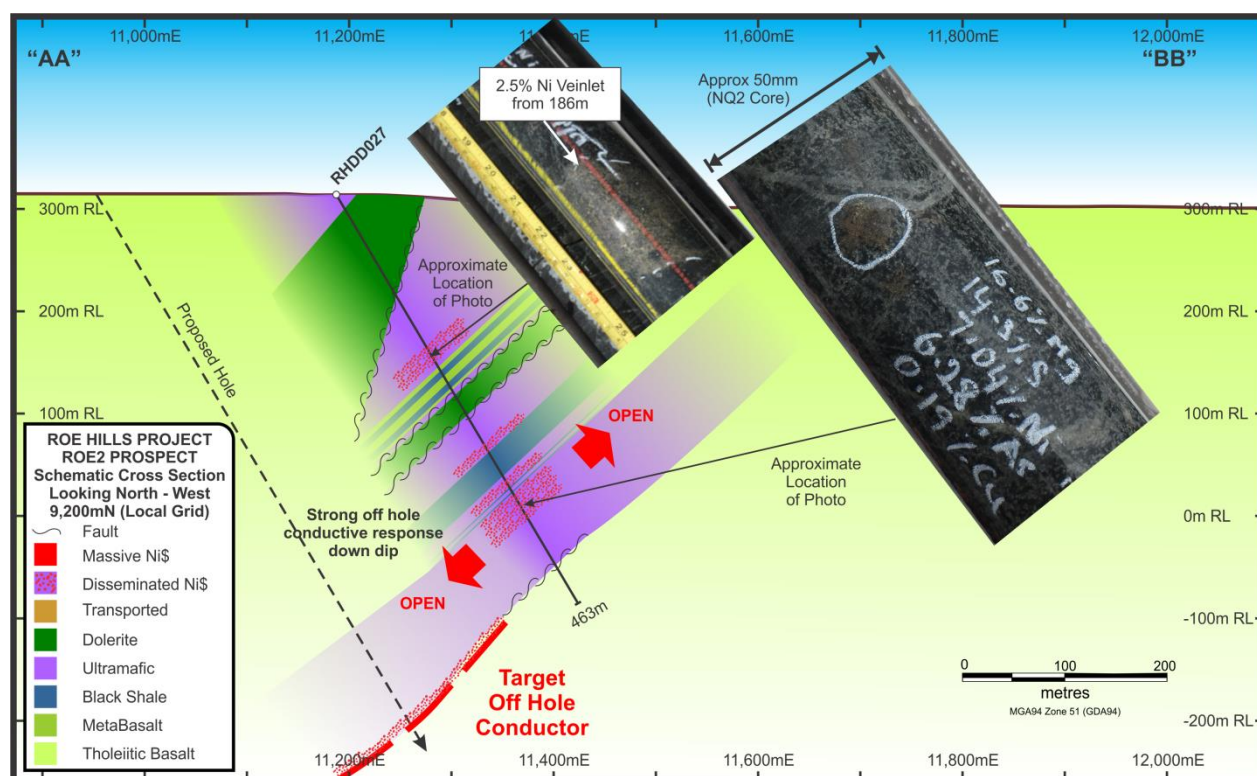

Figure 4: Talc Lake Drilling Locations

**Figure 5: Schematic Cross Section of Diamond Drill Hole RHDD0027**

## **TALC LAKE WEST**

Assays received for hole RHDD0023 at Talc Lake confirm the previously reported presence of nickel bearing sulphides (refer Figure 3 & 4 and ASX Announcement dated November 9, 2015).

The assay result for RHDD0023 was: 1.3m at 0.5% nickel; 1077ppm Cu; 81ppbPt; 139ppbPd from 256.8m

As reported previously, spot readings of sulphide blebs/veinlets within the zone sampled for assay using portable Niton XRF returned values up to 3.42% nickel.

Drillhole RHDD0028, which was targeted on a strong off-hole conductor identified from hole RHDD0023, encountered a zone of disseminated and blebby nickel bearing sulphides over approximately 1m from 277m in close proximity to the basal ultramafic contact without identifying a source of the conductor.

Spot readings of selected sulphide blebs within the mineralised zone using portable Niton XRF confirm nickel values up to 2.0%.

To better define the location of the conductor in order to assist ongoing drill testing of this high priority target, a DHEM survey of the hole was initiated. Unfortunately the survey was unable to be completed due to a blockage within the PVC casing installed within the hole.

As a consequence, a selection of key holes (RHDD0004 & 5; RHDD0023) previously completed in the area were re-surveyed utilising previously unavailable high powered DHEM equipment to ensure that the best possible definition is achieved prior to initiating further drilling.

A preliminary assessment of the data by Newexco has successfully identified a strong late time conductor located down dip/plunge of holes RHDD005 and RHDD0023 in a position coincident with interpreted basal ultramafic contact.

## **NARROW NECK**

Three RCP/Diamond drill holes (RHDD0029-31) have been completed at the Narrow Neck Prospect located approximately 15km north of Talc Lake and 3km south of Roe 2 as a preliminary assessment of the potential of this previously unexplored sequence to host nickel sulphide mineralisation (figure 4).

Each of the holes were designed to test a combination of MLEM/FLEM geophysical and conceptual geological targets identified within the western ultramafic sequence which is largely obscured beneath a veneer of transported lake sediments of variable, but relatively thin (<10m) thickness.

The first hole, RHDD0029 targeted MLEM Conductor NN\_C1 and encountered several zones of partially oxidised, patchy disseminated and blebby nickel bearing sulphides over approximately 20m between the down hole depths of 30m to 50m.

The mineralisation is hosted within high MgO talc carbonate altered ultramafics. Between 93.1m to 104.1m, and 109.8 to 112.2m RHDD0029 encountered several zones of barren massive pyrite/pyrrhotite within intensely altered footwall basalt. A subsequent DHEM survey of the hole has confirmed the barren massive sulphide interval to represent the source of NN\_C1.

Drillholes RHDD0030 and RHDD0031 targeted MLEM Conductors NN\_C4 and NN\_C5 situated 3km and 8.2km south of RHDD0029 respectively.

RHDD0030 traversed a similar sequence of talc carbonate altered ultramafics as encountered by RHDD0029 without significant mineralisation being noted. No source for the targeted conductor NN\_C4 was identified however a subsequent DHEM survey has reported a strong off-hole conductor situated below and to the south of the hole.

This position is potentially coincident with the basal contact of the ultramafic sequence. Work is ongoing to refine the target prior to further drilling.

RHDD0031 intersected sulphidic sediment at the modelled depth of the targeted NN\_C5 conductor. No significant mineralisation was identified.

## **COPTER COVE**

Located approximately 8.8km north of Talc Lake, the Copter Cove Prospect secures the northern strike extension of the eastern (presumed basal) sequences described at Talc Lake (Refer holes RHDD0026 & RHDD0027 above).

During the course of field mapping in the area, consulting geologist Sarah Dowling located and sampled several historical aircore chips presumably discarded from an earlier unknown phase of gold exploration. The samples comprised high MgO talc carbonate altered ultramafic showing visible oxidised disseminated and stringer sulphides.

Assays included the following:

Sample 101733: 0.4% Nickel; 645ppm Cu; 26ppb Pt; 12ppb Pd.

Drillhole RHDD0032, a first pass assessment of an otherwise unexplored area, was drilled to test a coincident MLEM geophysical anomaly (RHC14)/conceptual geological position and geochemical target (Refer Figure 3).

The hole traversed a sequence of ultramafics displaying trace amounts of disseminated nickel bearing sulphides with intercalated thin black shales successfully confirming the fertility of the sequence. Interpretation of DHEM survey data is in progress.

**Table 1: Drilling Summary, December 2015**

Hole ID	MGA_E	MGA_N	Dip	Az	Precollar	EOH
RHDD0023	461212	6537688	-60	57	46.7	395.2
RHDD0024	461156	6536384	-60	50	60	212.2
RHDD0025	460080	6538800	-60	90	79.9	282.9
RHDD0026	462175	6538100	-60	53	24.4	327.9
RHDD0027	461742	6538439	-60	50	14.8	463
RHDD0028	461108	6537800	-67	70	44.7	346
RHDD0029	454030	6550040	-60	90	21	142
RHDD0030	455590	6547375	-60	90	30	187
RHDD0031	455393	6546725	-60	90	22	219.4
RHDD0032	458602	6543250	-60	50	25.6	284.9

The company anticipates completing the current field program before Christmas, with high priority drilling planned to re-commence early in the new year. We look forward to providing further assay and geophysical results as they are received.
